Question

In March, the price of a collectible card was $\$15.50$. In April, the price of the collectible card was $\$17.36$. The price of the collectible card in April was $p\%$ of the price of the collectible card in March. What is the value of p?

Answer

A. 12

B. 88

C. 112

D. 188

Correct Answer: C

Rationale

Choice C is correct. It's given that the price of the collectible card was $\$15.50$ in March and $\$17.36$ in April. It's also given that the price of the collectible card in April was $p\%$ of the price in March. It follows that $\$17.36$ is $p\%$ of $\$15.50$. Therefore, the value of p can be calculated by solving the equation $17.36 = \left(\frac{p}{100}\right)(15.50)$, or $17.36 = \frac{15.50p}{100}$. Multiplying each side of this equation by 100 yields $1{,}736 = 15.50p$. Dividing each side of this equation by 15.50 yields $112 = p$. Therefore, the value of p is 112.

Choice A is incorrect. 12% is the percent increase in the price of the collectible card from March to April.

Choice B is incorrect and may result from conceptual or calculation errors.

Choice D is incorrect and may result from conceptual or calculation errors.
