Question ID: 73c091d2

Question

Many trees produce growth rings as they age, with each ring in a tree's trunk representing one year in the tree's life. This often makes it fairly easy to determine how old a tree was when it was cut down. To do so, you look at the tree stump and count the dark rings you see. But a researcher claims that this method often can't be used to identify the age of olive trees.

Which detail, if true, would most directly support the researcher's claim?

Answer

A. The oldest olive tree in the world is likely over 1,100 years old.

B. Narrow growth rings can suggest that an olive tree experienced harsh conditions.

C. Many olive trees have growth rings that are difficult to see.

D. Olive trees thrive in areas with hot, dry summers.
