Question ID: cac82f9b

Question

Biologist Natacha Bodenhausen and colleagues analyzed the naturally occurring bacterial communities associated with leaves and roots of wild *Arabidopsis thaliana*, a small flowering plant. The researchers found many of the same bacterial genera in both the plants' leaves and roots. To explain this, the researchers pointed to the general proximity of *A. thaliana* leaves to the ground and noted that rain splashing off soil could bring soil-based bacteria into contact with the leaves. Alternatively, the researchers noted that wind, which may be a source of bacteria in the aboveground portion of plants, could also bring bacteria to the soil and roots. Either explanation suggests that ______

Which choice most logically completes the text?

Answer

A. bacteria carried by wind are typically less beneficial to *A. thaliana* than soil-based bacteria are.

B. some bacteria in *A. thaliana* leaves and roots may share a common source.

C. many bacteria in *A. thaliana* leaves may have been deposited by means other than rain.

D. *A. thaliana* leaves and roots are especially vulnerable to harmful bacteria.
