

Question ID: 735a0a00

Question

$$y = 0.25x^2 - 7.5x + 90.25$$

The equation gives the estimated stock price y , in dollars, for a certain company x days after a new product launched, where $0 \leq x \leq 20$. Which statement is the best interpretation of $(x, y) = (1, 83)$ in this context?

Answer

- A. The company's estimated stock price increased **\$83** every day after the new product launched.
- B. The company's estimated stock price increased **\$1** every **83** days after the new product launched.
- C. **1** day after the new product launched, the company's estimated stock price is **\$83**.
- D. **83** days after the new product launched, the company's estimated stock price is **\$1**.
