Question

A store sells two different-sized containers of blueberries. The store’s sales of these blueberries totaled **896.86** dollars last month. The equation **$4.51x + 6.07y = 896.86$** represents this situation, where **x** is the number of smaller containers sold and **y** is the number of larger containers sold. According to the equation, what is the price, in dollars, of each smaller container?

Correct Answer: 4.51, 451/100

Rationale

The correct answer is **4.51**. It’s given that the equation **$4.51x + 6.07y = 896.86$** represents this situation, where **x** is the number of smaller containers sold, **y** is the number of larger containers sold, and **896.86** is the store’s total sales, in dollars, of blueberries last month. Therefore, **$4.51x$** represents the store’s sales, in dollars, of smaller containers, and **$6.07y$** represents the store’s sales, in dollars, of larger containers. Since **x** is the number of smaller containers sold, the price, in dollars, of each smaller container is **4.51**.
