

Question ID: 6989c80a

Question

$$F(x) = \frac{9}{5}(x - 273.15) + 32$$

The function F gives the temperature, in degrees Fahrenheit, that corresponds to a temperature of x kelvins. If a temperature increased by **2.10** kelvins, by how much did the temperature increase, in degrees Fahrenheit?

Answer

- A. **3.78**
- B. **35.78**
- C. **487.89**
- D. **519.89**
