

Question ID: b3abf40f

Question

$$F(x) = \frac{9}{5}(x - 273.15) + 32$$

The function F gives the temperature, in degrees Fahrenheit, that corresponds to a temperature of x kelvins. If a temperature increased by **9.10** kelvins, by how much did the temperature increase, in degrees Fahrenheit?

Answer

- A. **16.38**
- B. **48.38**
- C. **475.29**
- D. **507.29**
