Question

The three points shown define a circle. The circumference of this circle is $k\pi$, where k is a constant. What is the value of k ?

Correct Answer: 8

Rationale

The correct answer is 8. It's given that the three points shown define a circle, so the center of that circle is an equal distance from each of the three points. The point (6, 6) is halfway between the points (6, 2) and (6, 10), and is a distance of 4 units from each of those two points. The point (6, 6) is also a distance of 4 units from (2, 6). Because the point (6, 6) is the same distance from all three points shown, it must be the center of the circle. Since that distance is 4, it follows that the radius of the circle is 4. The circumference of a circle with radius r is equal to $2\pi r$. It follows that the circumference of the given circle is $2\pi(4)$, or 8π . It's given that the circumference of the circle is $k\pi$. Therefore, the value of k is 8.
