Question

The table summarizes the distribution of color and shape for **100** tiles of equal area.

	Red	Blue	Yellow	Total
Square	10	20	25	55
Pentagon	20	10	15	45
Total	30	30	40	100

If one of these tiles is selected at random, what is the probability of selecting a red tile? (Express your answer as a decimal or fraction, not as a percent.)

Correct Answer: 0.3, 3/10

Rationale

The correct answer is $\frac{3}{10}$. It's given that there are a total of **100** tiles of equal area, which is the total number of possible outcomes. According to the table, there are a total of **30** red tiles. The probability of an event occurring is the ratio of the number of favorable outcomes to the total number of possible outcomes. By definition, the probability of selecting a red tile is given by $\frac{30}{100}$, or $\frac{3}{10}$. Note that 3/10 and .3 are examples of ways to enter a correct answer.
