Question

During a study, the temperature, **in degrees Celsius ($^{\circ}\text{C}$)**, of the air in a chamber was recorded to the nearest integer at certain times. The scatterplot shows the recorded temperature y , **in $^{\circ}\text{C}$** , of the air in the chamber x minutes after the start of the study.

What was the average rate of change, **in $^{\circ}\text{C}$** per minute, of the recorded temperature of the air in the chamber from $x = 5$ to $x = 7$?
