Question

Catherine L. Cardelús is a researcher who studies canopy soil. Canopy soil is formed in a tree’s branches (its canopy) when dead leaves and other falling things collect. This material breaks down, becoming canopy soil. Canopy soil helps preserve a healthy water cycle (how water moves through the environment) in rainforests. This benefit is one reason Cardelús is interested in the canopy soils in large choibá trees in rainforests in Costa Rica.

Which choice best describes the text’s overall structure?

Answer

- A. It explains a disagreement between researchers and how it was resolved.
- B. It presents an idea and mentions a researcher who disagrees with that idea.
- C. It compares the sizes of two types of trees over several years.
- D. It introduces a researcher and gives information about what she researches.

Correct Answer: D

Rationale

Choice D is the best answer because it most accurately describes the overall structure of the text. The text begins by mentioning Catherine L. Cardelús, "a researcher who studies canopy soil." The text then provides information about her chosen research topic: the formation of canopy soil in tree branches, the role of canopy soil in preserving a healthy water cycle in rainforests, and Cardelús’s specific interest in "the canopy soils in large choibá trees in rainforests in Costa Rica." Thus, the text introduces a researcher and then gives information about what she researches.

Choice A is incorrect because the text doesn’t mention any disagreement between researchers, nor does it describe how such a disagreement was resolved. Choice B is incorrect because the text doesn’t present an idea that Cardelús disagrees with; rather, it describes her research interests and the significance of canopy soil. Choice C is incorrect because the text doesn’t compare the sizes of different types of trees over time. While the text mentions "large choibá trees," it doesn’t compare them to any other tree type or discuss changes in tree size over several years.
