

Question ID: 422c5068

Question

Generally it takes Tule geese about four days to migrate south for the winter. From their summer breeding grounds in Cook Inlet, Alaska, the birds begin by flying over the Gulf of Alaska, keeping about 100 miles from the Canadian shore. They pause to rest on the Pacific Ocean, then fly toward Summer Lake, Oregon, before finally arriving at their winter destination of Sacramento Valley, California. In 2020, however, it took the geese over twice as long to make their way from Cook Inlet to Sacramento Valley. According to researchers, the reason was airborne pollutants.

Which choice best states the function of the underlined portion in the text as a whole?

Answer

- A. It illustrates a change in Tule geese's usual flight behavior.
- B. It suggests an explanation for why Tule geese breed in Alaska.
- C. It describes part of the Tule geese's typical winter migration journey.
- D. It compares Tule geese to other birds that migrate south for the winter.
