

Question ID: e876e395

Question

While researching a topic, a student has taken the following notes:

- The melting rate of glaciers varies based on air temperature.
- In the warm summer months, massive glaciers on the coast of Greenland melt into the surrounding water.
- The melting glaciers contribute to rising sea levels each summer.
- Huge icebergs also break off Greenland's glaciers into the water and melt.
- In 2017, geoscientist Twila Moon found that the iceberg melting rate depends not on air temperature but on water temperature.
- Because water temperature is consistent, melting icebergs contribute to rising sea levels all year.

The student wants to emphasize a similarity between glaciers and icebergs in Greenland. Which choice most effectively uses relevant information from the notes to accomplish this goal?

Answer

- A. Because icebergs break off Greenland's glaciers into the water, their melting rate depends on water temperature.
- B. Greenland's glaciers and icebergs both melt during the year, contributing to rising sea levels.
- C. Geoscientist Twila Moon found that the melting rate of Greenland's icebergs, unlike that of glaciers, does not depend on air temperature.
- D. Glaciers on the coast of Greenland melt during the warm summer months into the surrounding water, the temperature of which remains consistent throughout the year.
