

Question

Economists Kerwin Kofi Charles and Melvin Stephens Jr. investigated a variety of factors that influence voter turnout in the United States. Using survey data that revealed whether respondents voted in national elections and how knowledgeable respondents are about politics, Charles and Stephens claim that the likelihood of voting is driven in part by potential voters' confidence in their assessments of candidates—essentially, the more informed voters are about politics, the more confident they are at evaluating whether candidates share their views, and thus the more likely they are to vote.

Which choice best describes data in the graph that support Charles and Stephens's claim?

- Answer**
- A. At each point on the political orientation scale, high-information voters were more likely than low-information voters to vote.
 - B. Only low-information voters who identify as independents had a voting probability below 50%.
 - C. The closer that low-information voters are to the ends of the political orientation scale, the more likely they were to vote.
 - D. High-information voters were more likely to identify as strong Democrats or strong Republicans than low-information voters were.
