

Question ID: f2f3fa00

Question

During a 5-second time interval, the average acceleration a , in meters per second squared, of an object with an initial velocity of 12 meters per second is defined by the equation $a = \frac{v_f - 12}{5}$, where v_f is the final velocity of the object in meters per second. If the equation is rewritten

in the form $v_f = xa + y$, where x and y are constants, what is the value of x ?
