Question

If $f(x) = \frac{x^2 - 6x + 3}{x - 1}$, what is $f(-1)$?

Answer

- A. -5
- B. -2
- C. 2
- D. 5

Correct Answer: A

Rationale

Choice A is correct. Substituting -1 for x in the equation that defines f gives $f(-1) = \frac{(-1)^2 - 6(-1) + 3}{(-1) - 1}$. Simplifying the expressions in the numerator and denominator yields $\frac{1 + 6 + 3}{-2}$, which is equal to $\frac{10}{-2}$ or -5 .

Choices B, C, and D are incorrect and may result from misapplying the order of operations when substituting -1 for x .
