

Question ID: 52e589f9

Question

$$m(t) = -0.0274\left(\frac{t}{7}\right)^2 + 7.3873\left(\frac{t}{7}\right) + 75.032$$

The function m gives the predicted body mass $m(t)$, in **kilograms (kg)**, of a certain animal t days after it was born in a wildlife reserve, where $t \leq 390$. Which of the following is the best interpretation of the statement “ $m(330)$ is approximately equal to **362**” in this context?

Answer

- A. The predicted body mass of the animal was approximately **330 kg 362** days after it was born.
- B. The predicted body mass of the animal was approximately **362 kg 330** days after it was born.
- C. The predicted body mass of the animal was approximately **362 kg $\frac{330}{7}$** days after it was born.
- D. The predicted body mass of the animal was approximately **$\frac{330}{7}$ kg 362** days after it was born.
