

Question ID: e1391dd6

Question

According to Moore's law, the number of transistors included on microprocessors doubles every 2 years. In 1985, a microprocessor was introduced that had 275,000 transistors. Based on this information, in which of the following years does Moore's law estimate the number of transistors to reach 1.1 million?

Answer

A. 1987

B. 1989

C. 1991

D. 1994
