Question

The function g is defined by $g(x) = 4x - 6$. What is the value of $g(-7)$?

Answer

- A. ~~−34~~
- B. ~~−22~~
- C. ~~$-\frac{13}{4}$~~
- D. ~~$-\frac{1}{4}$~~

Correct Answer: A

Rationale

Choice A is correct. It’s given that the function g is defined by $g(x) = 4x - 6$. Substituting -7 for x into the given equation yields $g(-7) = 4(-7) - 6$, or $g(-7) = -34$.

Choice B is incorrect and may result from conceptual or calculation errors.

Choice C is incorrect and may result from conceptual or calculation errors.

Choice D is incorrect. This is the value of x for which $g(x) = -7$, not the value of $g(-7)$.
