Question

Ty set a goal to walk at least **24** kilometers every day to prepare for a multiday hike. On a certain day, Ty plans to walk at an average speed of **4** kilometers per hour. What is the minimum number of hours Ty must walk on that day to fulfill the daily goal?

Answer

- A. **4**
- B. **6**
- C. **20**
- D. **24**

Correct Answer: B

Rationale

Choice B is correct. It's given that Ty plans to walk at an average speed of **4** kilometers per hour. The number of kilometers Ty will walk is determined by the expression **4s**, where **s** is the number of hours Ty walks. The given goal of at least **24** kilometers means that the inequality **4s ≥ 24** represents the situation. Dividing both sides of this inequality by **4** gives **s ≥ 6** , which corresponds to a minimum of **6** hours Ty must walk.

Choice A is incorrect and may result from conceptual or calculation errors.

Choice C is incorrect and may result from conceptual or calculation errors.

Choice D is incorrect and may result from conceptual or calculation errors.
