Question

In the  $xy$ -plane above, points P, Q, R, and T lie on the circle with center O. The degree measures of angles  $POQ$  and  $ROT$  are each  $30^\circ$ . What is the radian measure of angle  $QOR$  ?

Answer

- A.  $\frac{5}{6} \pi$
- B.  $\frac{3}{4} \pi$
- C.  $\frac{2}{3} \pi$
- D.  $\frac{1}{3} \pi$

Correct Answer: C

Rationale

Choice C is correct. Because points T, O, and P all lie on the  $x$ -axis, they form a line. Since the angles on a line add up to  $180^\circ$ , and it's given that angles  $POQ$  and  $ROT$  each measure  $30^\circ$ , it follows that the measure of angle  $QOR$  is  $180^\circ - 30^\circ - 30^\circ = 120^\circ$ . Since the arc of a complete circle is  $360^\circ$  or  $2 \pi$  radians, a proportion can be set up to convert the measure of angle  $QOR$  from degrees to radians:

$\frac{360 \text{ degrees}}{2 \pi \text{ radians}} = \frac{120 \text{ degrees}}{x \text{ radians}}$ , where  $x$  is the radian measure of angle  $QOR$ . Multiplying each side of the proportion by  $2 \pi x$  gives  $360x = 240 \pi$ . Solving for  $x$  gives  $\frac{240}{360} \pi$ , or  $\frac{2}{3} \pi$ .

Choice A is incorrect and may result from subtracting only angle  $POQ$  from  $180^\circ$  to get a value of  $150^\circ$  and then finding the radian measure equivalent to that value. Choice B is incorrect and may result from a calculation error. Choice D is incorrect and may result from calculating the sum of the angle measures, in radians, of angles  $POQ$  and  $ROT$ .
