Question

The histogram summarizes data set A, which represents the number of points per player earned by **50** players of a game. A new player earns **18** points playing the game, and this number of points is added to data set A to create data set B with **51** values. Which of the following must be true?

- I. The median number of points per player for data set B is less than the median number of points per player for data set A.
- II. The mean number of points per player for data set B is less than the mean number of points per player for data set A.

Answer

- A. I only
- B. II only
- C. I and II
- D. Neither I nor II
