Question

A survey taken by 1,000 students at a school asked whether they played school sports. The table below summarizes all 1,000 responses from the students surveyed.

	Males	Females
Play a school sport	312	220
Do not play a school sport	?	216

How many of the males surveyed responded that they do not play a school sport?

Answer

- A. 109
- B. 252
- C. 468
- D. 688

Correct Answer: B

Rationale

Choice B is correct. The table summarizes all 1,000 responses from the students surveyed. If 312 are males who play a sport, 220 are females who play a sport, and 216 are females who do not play a sport, then $1,000 - 312 - 220 - 216 = 252$ males who do not play a sport.

Choices A, C, and D are incorrect. If 109 males who do not play a sport responded, then the table summary would be $109 + 312 + 220 + 216 = 857$ total student responses rather than 1,000. If 468 males who do not play a sport responded, then the table summary would be $468 + 312 + 220 + 216 = 1,216$ total student responses rather than 1,000. If 688 males who do not play a sport responded, then the table summary would be $688 + 312 + 220 + 216 = 1,436$ total student responses rather than 1,000.
