

## Question ID: fcc328c6

### Question

Streams and rivers carry soil and rocks from one location to another. But there is another way for these geological materials to move. Scientists call this process “aeolian transport.” In aeolian transport, winds move small particles of soil or rock over potentially great distances. Geologist Melisa Diaz and her team studied dust in Antarctica to find out if it was moved by aeolian transport. They discovered that the dust matched geological material in Australia. Aeolian transport had carried it from one continent to another, across thousands of miles of open ocean.

Which choice best describes the function of the underlined portion in the text as a whole?

### Answer

- A. It presents Melisa Diaz’s remarks about difficulties that her team encountered.
- B. It introduces a scientific term that is used in the discussion that follows.
- C. It emphasizes the surprising nature of the findings that are presented.
- D. It explains the difference between two kinds of geological material.
