

Question ID: e6b1e12c

Question

Long thought to be sessile (immobile), adult *Chelonibia testudinaria*, barnacles that adhere to sea turtle shells, have been observed to shift slightly in position over time—a phenomenon that has been attributed to the barnacles' passive displacement by water currents. _____ a research team found that adult *C. testudinaria* moved toward the heads of their sea turtle hosts and thus against the prevailing water flow, behavior consistent with self-initiated locomotion.

Which choice completes the text with the most logical transition?

Answer

- A. Contrary to this phenomenon,
- B. Undermining this explanation,
- C. Drawing a similar conclusion,
- D. Confirming this hypothesis,
